Sirakova T., Kolatukudy P.E., Murwin D., Billy J., Leake E., Lim D., Demaria T., Bakaletz L.;
"Role of fimbriae expressed by nontypeable Haemophilus influenzae in pathogenesis of and protection against otitis media and relatedness of the fimbria subunit to outer membrane protein A.";
Infect. Immun. 62.2002-2020(1994).
-I- FUNCTION: Acts as a fimbriae subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
P5 of Haemophilus influenzae.";
Infect. Immun. 61:4017-4020(1993).
-!- SUBCELLULAR LOCATION: Integral membrane protein. Outer membrane.
-!- SIMILARITY: Belongs to the ompA family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -i- SUBCELLULAR LOCATION: Integral membrane protein. -!- SUBCELLIANE LOCATION: Outer membrane (By similarity).
-!- MISCELLANEOUS: This protein is subject to phase-variable expression associated with alteration in the length of the CCAA repeat region. This mechanism is called slipped-strand mispairing. Addition or loss of CCAA repeat units would change the reading frame and result in introduction of stop codons downstream of the repeat region. This may be a mechanism of regulation and a way to avoid the immunological response of the host (By similarity).
-!- SIMILARITY: BELONGS TO THE TONB-DEPENDENT RECEPTOR PROTEIN FAMILY; HEMOGLOBIN/HAPTOGLOBIN BINDING PROTEIN SUBFAMILY.
-!- CAUTION: This is a conceptual translation; the sequence was elongated in the N-terminal section, then a frameshift was introduced in the repeats region to maximize the similarity with

MISCELLANEOUS: This protein is subject to phase-variable expression associated with alteration in the length of the CCDA repeat region. This mechanism is called slipped-strand mispairing. Addition or loss of CCDA repeat units would change the reading frame and result in introduction of stop codons downstream of the repeat region. This may be a mechanism of regulation and a way to avoid the immunological response of the host.

SIMILARITY: BELONGS TO THE TONB-DEPENDENT RECEPTOR PROTEIN FAMILY; HEMOGLOBIN/HAPTOGLOBIN BINDING PROTEIN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Outer membrane; Receptor; Repeat; Signal; TonB box;

"I moglobin/haptoglobin complex of the human host and is required for heme uptake (By similarity).

"SUBCELLIANEOUS: This protein is subject to phase-variable expression associated with alteration in the length of the CCAA repeat region. This mechanism is called slipped-strand mispairing.

Addition or loss of CCAA repeat units would change the reading frame and result in introduction of stop codons downstream of the repeat region. This may be a mechanism of regulation and a way to avoid the immunological response of the host (By similarity).

"The may be a mechanism of segulation and a way to avoid the immunological response of the host (By similarity).

"This may be a mechanism of regulation and a way to avoid the immunological response of the host (By similarity).

antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza. Novel

Example 1; Page 29; 68pp; English.

The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae, Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79953, and AAX291201 to AAX21252, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                          The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various flamophilus influenzae strains. The peptides are used for disgnosis, prevention, and treatment of Heamophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae, Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. ANY19955 to ANY19931, and AAZ91201 to AAZ91221 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY19955 to AAY19993, and

                                                                                                                                                                                                                                                                                                                            Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitls media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91222, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LBI(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argll7 to G1V15. This peptide represents the third exposed loop of PS and is a potential B call epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influence infection or associated disease, e.g., otitis media and conjunctivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunoglobulin E; IgE; immunogenic; immunogen; Protein D; carrier;

Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV71955 to AAV71993, and AAX91201 to AAX91202, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠ
                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an immunogen (I) comprising a peptide (Ia) and a carrier (Ib) derived from protein D of Haemophilus influenzae (Ia) and a carrier (Ib) derived from protein D of Haemophilus influenzae or its fragment. Also described are: (I) a vaccine comprising (I), and an exciptant; (2) preparation of (I), comprising conjugating a peptide to protein D or its fragment; and (3) preparation of a vaccine of (1), comprising formulating (I) with an exciptent. (I) has cytostartic, comprising formulating (I) with an exciptent (I) has cytostartic, and the vaccine are useful for the manufacture of a medicament for preventing and treating infectious diseases such as malaria or chronic disease such as cancer, Alzheimer's disease such as malaria or chronic collisease such as malaria and response while inducing a moderate humoral response against the immunogenes while inducing a moderate humoral response against the carrier. The present sequence represents an IblgrI peptide which was coupled through an additional C-terminal cysteine via maleimide to protein D in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                       Immunogens and vaccine comprising the immunogen useful for preventing and treating infectious diseases e.g. malaria and chronic disease e.g. cancer, comprises peptide and carrier from protein D of influenzae.

The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argll7 to Gly135. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of boing in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus sinfluenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant bacterial outer membrane protein where one or more surface-
exposed loops are modified is useful as a vaccine to prevent or treat
Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope; immunogenic composition; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

prevention, and treatment of Haemondhilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. finfluenzae and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79933, and AAS91201 to AA291252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH) infection and otitis media. The synthetic peptides do not require tedious purification techniques. The present sequence represents the amino acid sequence of the chimeric fimbrin peptide LB1.
 Haemophilus influenzae strains. The peptides are used for diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic chimeric fimbrin peptide, useful for treating Haemophilus

                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a chimeric finbrin/T-cell epitope peptide and is designated LBI. The peptide comprises a 19 amno acid sequence corresponding to amino acid sulf. 115 of the fimbrin protein, the linker sequence and amino acid 288-117.115 of the measles virus fusion protein (a T-cell epitope)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antigenic P5-like fimbrin subunit peptides used in vaccines against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a T cell epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against nontypable Haemophilus influenzae (NTHi) and for preventing or reducing adherence of NTHi to host cells thereby preventing or reducing the severity of otitis media. The present sequence is an H. influenzae fimbrin peptide/measles virus T cell epitope chimaeric peptide of the invention, LB1.
                                                                                                                                                                                                                                                                                                                                                                Novel synthetic chimeric fimbrin peptide LB1 or LB2 comprising a first peptide unit, T cell epitope as second peptide unit and third linker peptide unit, useful for preventing or reducing severity of otitis media.

The fimbrin proteins from 15 randomly selected type b and non- typable clinical isolates of Haemophilus influenzae share common epitopes. Thus frimbrin isolated from non-typable Haemophilus influenzae 1128 strain is a particularly suitable immunogen to protect against the different non-typable HJ. influenzae that cause otitis media. Fimbrin protein is sproduced by culturing a transformed microbial host., pref. E.coli, Spordooptera frugiperda or a mucosal pathogen. Fimbrin protein (FP) produced by this process is claimed. The FP protein migrates in polyacrylamide genes to a posn. equiv. to a mol. Wt. of 25.5 kD or 37.5 kD. (Updated on 25-WAR-2003 to correct PM field.) (Updated on 25-WAR-2003 to correct PM field.) Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                    The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX719955 to AAX719993, and AAX21201 to AAX291252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. The peptides may also be used in vaccines against H. influenzae and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY19955 to AAX79993, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV71955 to AAY7993, and AAX91201 to AAX91202, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                  antigenic P5-like fimbrin subunit peptides used in vaccines against
